

fcexception

```
classDiagram
    class fcexception
    class fcRuntimeError {
        - const char * why
        + fcRuntimeError(const char *whyError="runtime error occurred")
        + const char * what()
    }
    fcRuntimeError --|> fcexception
```

The diagram shows a class hierarchy. At the top is a class named 'fcexception' with an empty box below its name. Below it is a class named 'fcRuntimeError' with a grey background. A blue arrow points from the 'fcRuntimeError' class to the 'fcexception' class, indicating inheritance.

fcRuntimeError

- const char * why

+ fcRuntimeError(const
char *whyError="runtime
error occurred")

+ const char * what()
